

Data Visualization for some columns

Importing some important Libraries like seaborn and matplotlib for visualization

Importing Libraries

```
In [6]: import pandas as pd
import numpy as np
import matplotlib.pyplot as plt
import seaborn as sns
```

I used Pie chart because it helps organize and show data as a percentage of a whole

Pie chart for Salt_Amount column

```
In [20]: labels = df['Salt_Amount'].value_counts().index
values = df['Salt_Amount'].value_counts().values

plt.pie(values, labels = labels ,colors= colors, autopct = '%.0f%%' )
plt.title('Chart title')

plt.show()
```

Pie chart for Loving food column

```
In [21]: labels = df['LovingFood'].value_counts().index
values = df['LovingFood'].value_counts().values
plt.pie(values, labels = labels, colors= colors , autopct = '%.0f%%' )
plt.title('Chart title')

plt.show()
```

Pie chart for Food Regime column and Diet column

```
In [14]: labels = df['Food Regime'].value_counts().index # Taking the all index
         values = df['Food Regime'].value_counts().values # Taking the all value

         colors = sns.color_palette('pastel')

         plt.pie(values, labels = labels , colors = colors, autopct = '%.0f%%' )
         plt.title('Chart title')

         plt.show()
```

```
In [15]: labels = df['Diet'].value_counts().index
         values = df['Diet'].value_counts().values

         plt.pie(values, labels = labels , colors = colors, autopct = '%.0f%%' )
         plt.title('Chart title')

         plt.show()
```

Pie chart for Spicy food column and eating various vegetables/fruits

```
In [16]: labels = df['SpicyFood'].value_counts().index
values = df['SpicyFood'].value_counts().values

plt.pie(values, labels = labels , colors = colors, autopct = '%.0f%%' )
plt.title('Chart title')

plt.show()
```

```
In [17]: labels = df['EatingVarious_Vegetables/Fruits'].value_counts().index
values = df['EatingVarious_Vegetables/Fruits'].value_counts().values

plt.pie(values, labels = labels , colors = colors, autopct = '%.0f%%' )
plt.title('Chart title')

plt.show()
```

Barplot used to represent data in the form of rectangle bars

barplot for Preferred drink column

```
In [19]: labels = df['Preferred_Drink'].value_counts().index  
values = df['Preferred_Drink'].value_counts().values  
plt.figure(figsize=(15,10))  
sns.barplot(labels,values)
```

Out[19]: <AxesSubplot:>

barplot for Education column

```
In [8]: plt.figure(figsize=(10,10))  
  
labels = df['Education'].value_counts().index  
values = df['Education'].value_counts().values  
sns.barplot(labels,values)
```

Out[8]: <AxesSubplot:>

```
In [12]: x = df["Preferred_Meal_Aday"]
plt.plot(x)
plt.title("Distribution of Preferred Meal a day")
plt.xlabel("Preferred Meal A day")
plt.show()
```
